Fatal Work Injuries in Minnesota — 2013

Fatal work injuries totaled 67 in 2013 for Minnesota, the U.S. Bureau of Labor Statistics reported today. Regional Commissioner Charlene Peiffer noted that while the 2013 count was preliminary, the number of work-related fatalities in Minnesota was down from the 70 recorded in 2012. Fatal occupational injuries in the state have ranged from a high of 113 in 1993 to a low of 60 in 2011. (See [chart 1](#).)

Nationwide, a preliminary total of 4,405 fatal work injuries were recorded in 2013, down from a revised count of 4,628 fatalities in 2012, according to results from the Census of Fatal Occupational Injuries (CFOI) program. Final 2013 CFOI data will be released in the late spring of 2015.

Chart 1. Total fatal occupational injuries, Minnesota, 2004—2013

NOTE: Data for 2013 are preliminary.

SOURCE: U.S. Bureau of Labor Statistics.

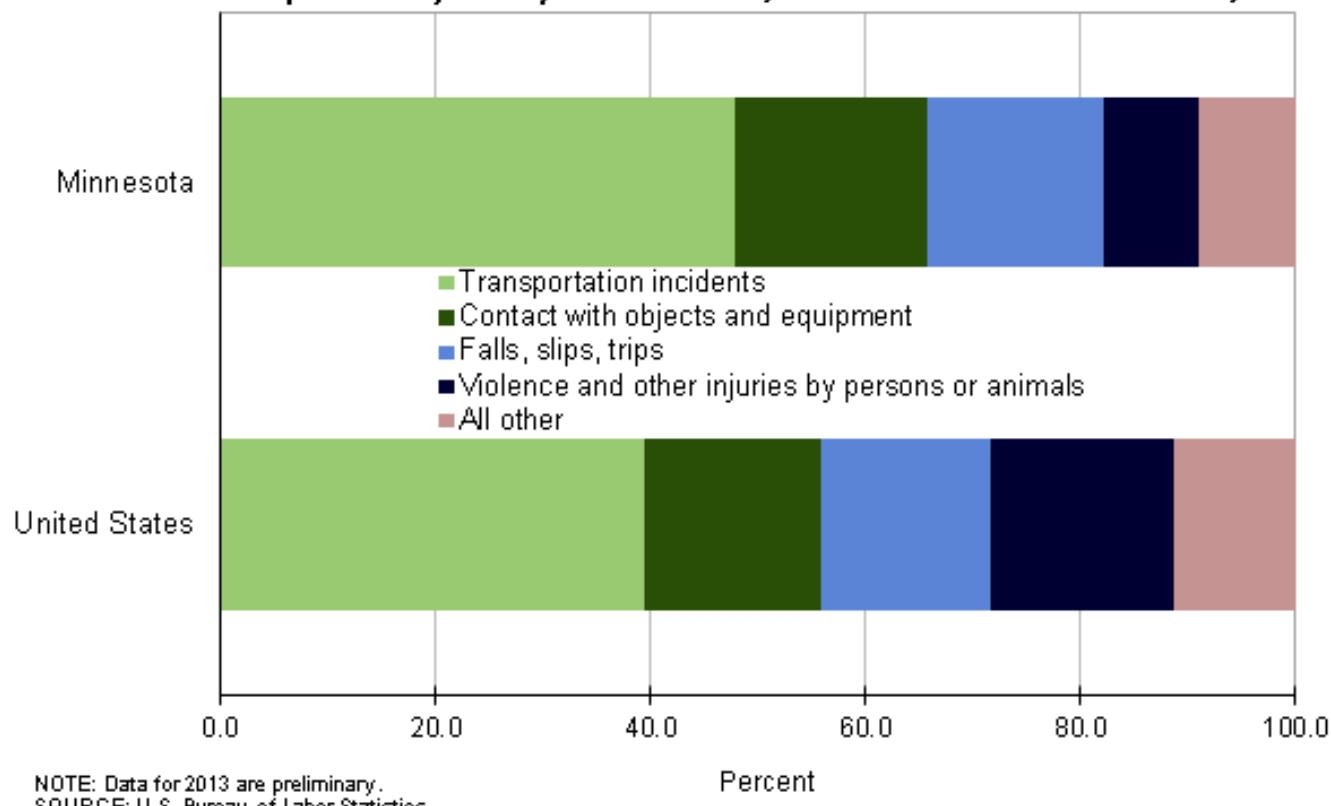

Of the 67 fatal work injuries reported in Minnesota in 2013, 32 resulted from transportation incidents, 12 from contact with objects and equipment, and 11 from falls, slips and trips. These three major categories

accounted for just over four-fifths of all fatal work injuries. Other major event categories each reported six or fewer deaths.

Within transportation incidents, roadway incidents involving motorized land vehicles was the most frequent type of workplace fatality with 15 deaths, accounting for 22 percent of all on-the-job fatalities in the state. (See [table 1](#).) The second-largest event in transportation incidents, non-roadway incidents involving motorized land vehicles, accounted for six fatalities. In the contact with objects and equipment category, 11 fatalities resulted from workers being struck by objects or equipment. In the falls, slips, and trips category, all 11 deaths occurred from falls. (Note that transportation counts presented in this release are expected to rise when updated 2013 data are released in the late spring of 2015 because key source documentation detailing specific transportation-related incidents has not yet been received.)

In the United States, transportation incidents were also the most frequent fatal workplace event in 2013, accounting for 40 percent of fatal work injuries. Minnesota's 48-percent share of on-the-job fatalities due to this event was higher than the nationwide share. (See [chart 2](#).) Violence and other injuries was the second most frequent type of event nationally with 17 percent of work-related fatalities; the share in Minnesota for this event was 9 percent. Contact with objects or equipment and falls, slips, and trips each accounted for 16 percent of the nation's workplace fatalities, while in Minnesota, these events accounted for 18 and 16 percent of the workplace fatalities, respectively.

Chart 2. Fatal occupational injuries by selected event, Minnesota and the United States, 2013

Additional key characteristics:

- The agriculture, forestry, fishing, and hunting industry sector had the largest number of fatalities in the state with 15, down from the 21 recorded in 2012. (See [table 2](#).) Within this industry sector,

transportation incidents accounted for eight worker deaths.

- Construction recorded 11 fatalities, compared to 13 in 2012. Falls, slips, and trips accounted for five on-the-job fatalities in construction.
- Transportation and material moving occupations had the highest number of fatal work injuries with 17. (See [table 3](#).) Nine of these fatalities were heavy and tractor-trailer truck drivers. Workers in management occupations had the next highest fatality count at 14.
- Men accounted for 63, or 94 percent, of the work-related fatalities in the state. (See [table 4](#).) Transportation incidents made up nearly one-half (30) of these fatalities.
- In Minnesota, 88 percent of those who died from a workplace injury were white non-Hispanics. Nationwide, this group accounted for 68 percent of work-related deaths.
- Workers 25-54 years old—the prime working age group—accounted for 30 fatalities, or 45 percent, of the state's work-related deaths in 2013. Workers in this group nationally accounted for 60 percent of on-the-job fatalities.
- Of the 67 persons that suffered fatal work injuries in Minnesota, 76 percent worked for wages and salaries; the remaining were self-employed. The most frequent fatal event for both groups was transportation incidents.

Technical Note

Background of the program. The Census of Fatal Occupational Injuries, part of the BLS occupational safety and health statistics program, compiles a count of all fatal work injuries occurring in the United States during the calendar year. The program uses diverse state, federal, and independent data sources to identify, verify, and describe fatal work injuries. This assures counts are as complete and accurate as possible.

For technical information about the CFOI program, please go to the BLS Handbook of Methods on the BLS web site at www.bls.gov/opub/hom/homch9.htm.

Federal/State agency coverage. The Census of Fatal Occupational Injuries includes data for all fatal work injuries, whether the decedent was working in a job covered by the Occupational Safety and Health Administration (OSHA) or other federal or state agencies or was outside the scope of regulatory coverage. Thus, any comparison between the BLS fatality census counts and those released by other agencies should take into account the different coverage requirements and definitions being used by each agency.

Acknowledgments. The Bureau of Labor Statistics appreciates the efforts of all federal, state, local, and private sector entities that submitted source documents used to identify fatal work injuries, in particular the Minnesota Department of Labor and Industry.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: (202) 691-5200; Federal Relay Service: (800) 877-8339.
